

Brooks' Patent Insulator,

Works, No. 22 South 21st Street.

Philadelphia, Jan 14 1874

Friend Ashley:

I have just sent David round to Mrs Thompsons factory. They are at work there and the foreman says they want the advertisement continued and he will try and have it paid. Mrs Thompson has two or three boys who have control of affairs nominally but they are generally in bed in the forenoon and in the lager beer saloons in the after part of the day.

On the 7th inst during the 3rd day of rain the Kewaska insulator gave 1400 degrees deflection to the Boston glass 320. The Kewaska falling below all others

I refer to the Kenosha that
have been exposed one year
to Seal Stage

I sent a copy or record of
14 tests as compared to a
a set of glass beginning with

10 degrees for the Kenosha to 2440
for the glass and ending as
before stated. From advices

from my friends I think
the Kenosha has run the
length of its tether. How does
those show at Elizabeth
Lee Pope to let me hear
from him.

Yours truly

Sam Brooks
